Oral
The Community Coordinated Modeling Center (CCMC, http://ccmc.gsfc.nasa.gov) is a multi-agency partnership to enable, support and perform the research and development for next-generation space science and space weather models. The CCMC provides, to the international research community, access to modern space science simulations. This is primarily through Runs-on-Request, a free service open to anyone interested in running space weather models hosted by the CCMC. In this presentation I highlight the solar and heliospheric modeling options currently available from CCMC for scientific investigations. I will also provide an update on new additions and models coming soon to the CCMC.
