4. Ultimate Goal

# CESSI - STORM Interaction Module aka STORMI

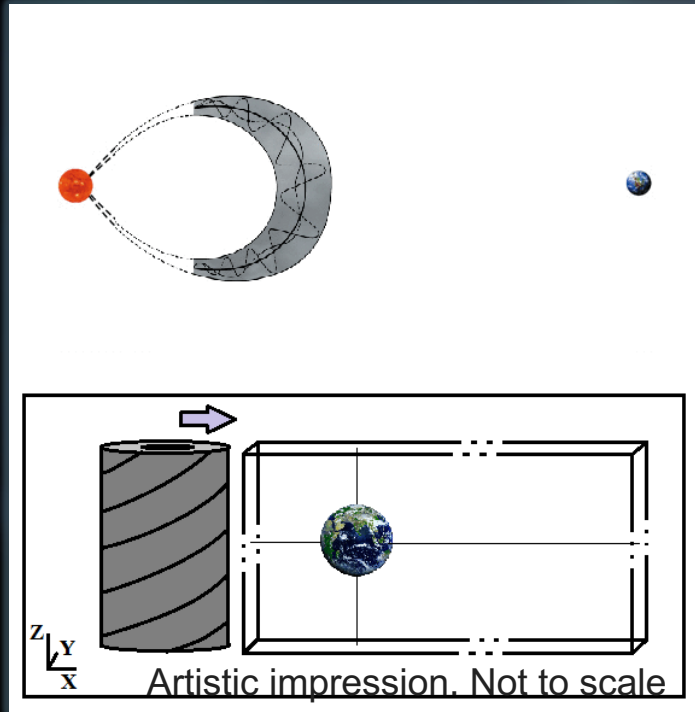

1. Context

# 2. Approach

3. Results

4. Ultimate Goal

# What is inside of STORMI?

3D Magnetohydrodynamic  
simulation using

**PLUTO** architecture

## Assumptions:

- “Far out” earth-like planet
- Intrinsic dipolar planetary magnetic field
- Stellar wind as magnetised shock
- Non-relativistic, compressible, Adiabatic fluid  $\Gamma = 5/3$
- High Magnetic Reynolds number
- Lundquist or Gold-Hoyle type flux rope with no axial curvature
- expansion is assumed negligible during computation

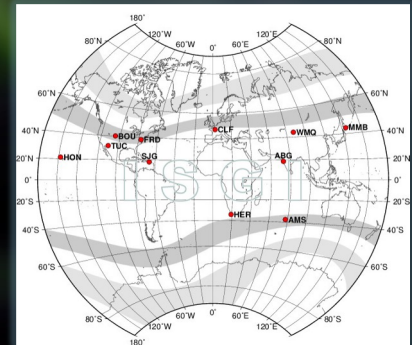

# Induced Currents!!

## Magnetospheric current

## Biot-Savart law

$$\vec{B}(\mathbf{r}) = \frac{1}{c} \int_{\mathcal{V}'} \frac{\vec{J}(\mathbf{r}') \times \vec{r}'}{r'^3} d\mathcal{V}'.$$

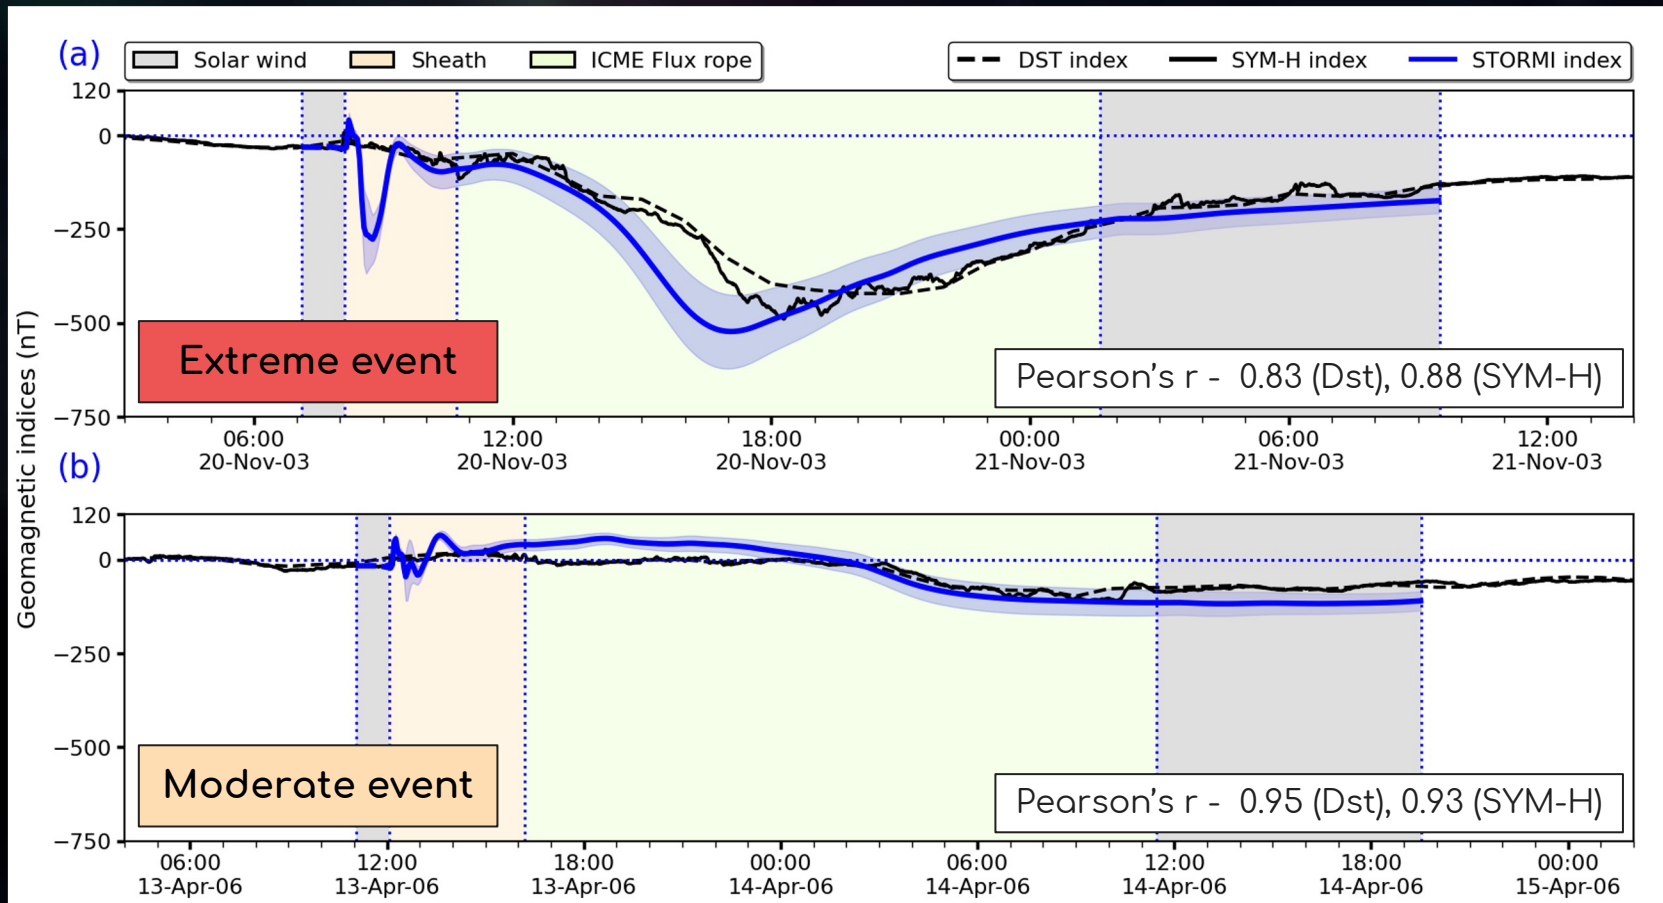

1. Context

2. Approach

**3. Results**

4. Ultimate Goal

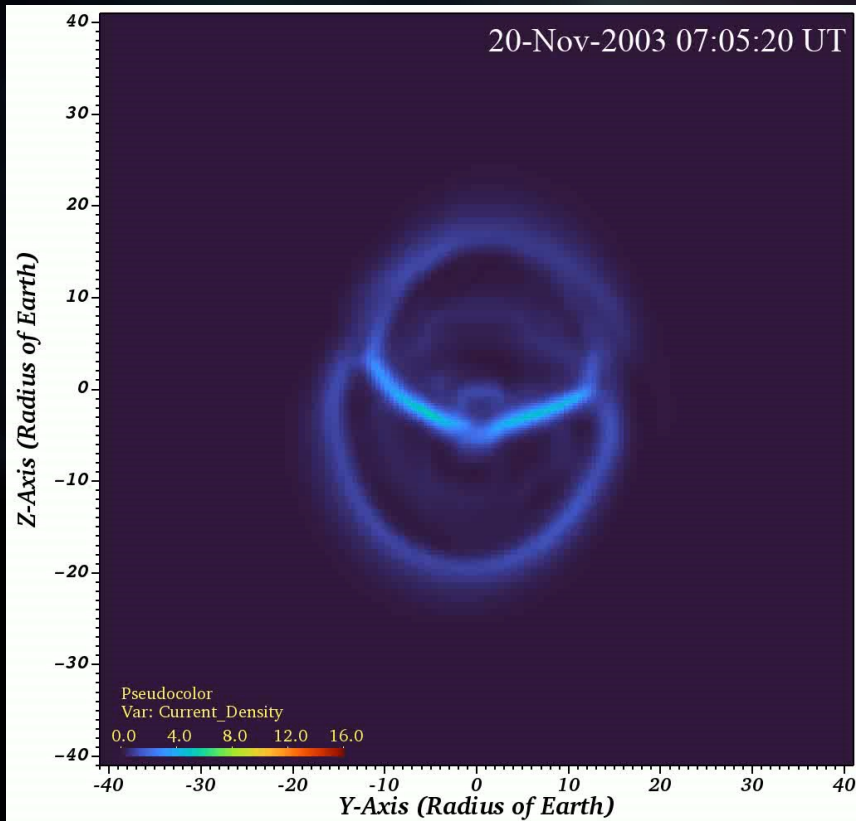

# Prediction of Space Weather

# Can we solve the magnetospheric dynamics?

Simulated using STORMI

Observed by Geotail spacecraft

Ref: Christon et. al., Space Physics, 103, A10,1998

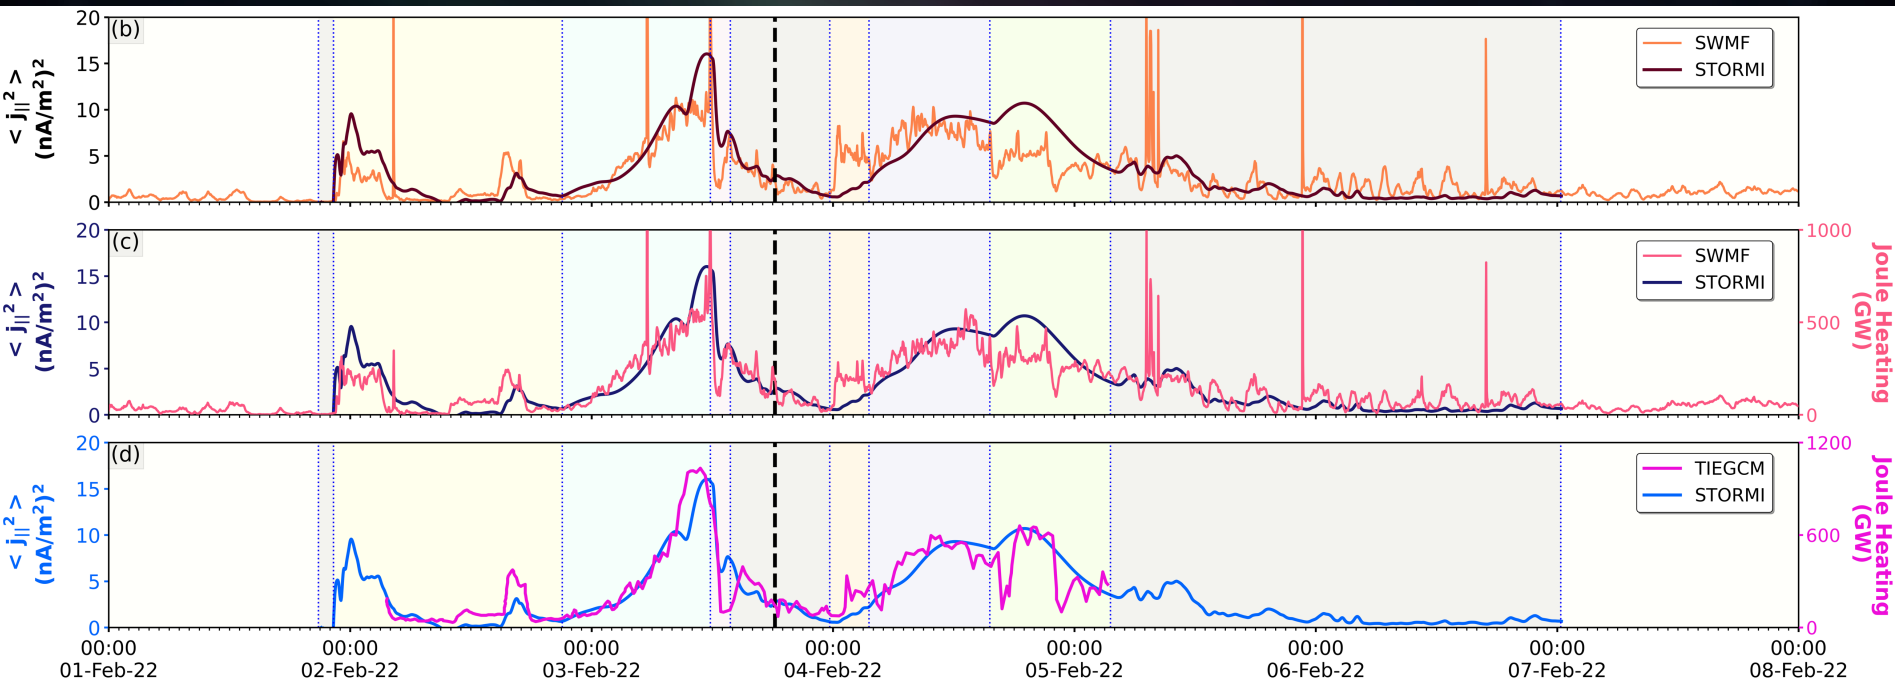

Magnetotail Plasma Regime Identification

# Can we solve the magnetospheric dynamics?

The Joule heating leads to  $\frac{dP}{dV} \propto j^2$

Averaged over a geocentric sphere of  $8 R_E$

1. Context
2. Approach
3. Results

# 4. Ultimate Goal

# Are we predicting the Dst/SYM-H index?

## Technically NO !!

Because we are not using particle definition of plasma or ring current physics

## BUT

As a proxy of Dst/ SYM-H, our Index performs well in estimating the geoeffectiveness and temporal evolution of a storm.

## AND

sacrificing intricate complexities, we focus on the development of a simple, time-efficient modelling framework with reasonably good prediction skills.

# Can we predict geoeffectiveness in real time?

## Unfortunately, NO !!

Because with our current computation power, it takes few hours to days to run a complete simulation.

## Whereas

It takes around 40 - 60 minutes for an ICME to reach from L1 point to Earth.

## But

It is not completely impossible.

# Can we predict geoeffectiveness in real time?

# Possibilities!!!!

- ICME driven space weather for (exo)planetary bodies and validate observations.
- Incorporate ionospheric physics and make it more robust.
- Incorporate multi-fluid MHD.
- Increase computational efficiency.
- Any thing you want to suggest!!
