TREC is a new academic initiative to serve as a national center of excellence in cross-disciplinary research, technological innovation and education in space weather. As an academic endeavor, SWx TREC provides new pathways for federal agencies, academia, commercial partners and industry to collaboratively address the nation's evolving space weather forecasting, mitigation and response needs.

Addressing R2O and O2R Problems

R2O-O2R Center Version

Sunspots

Sunspots are comparatively cool areas at up to 7,700° F and show the location of strong magnetic fields protruding through what we would see as the Sun's surface. Large, complex sunspot groups are generally the source of significant space weather.

Coronal Mass Ejections (CMEs)

Large portions of the corona, or outer atmosphere of the Sun, can be explosively blown into space, sending billions of tons of plasma, or superheated gas, Earth's direction. These CMEs have their own magnetic field and can slam into and interact with Earth's magnetic field, resulting in geomagnetic storms. The fastest of these CMEs can reach Earth in under a day, with the slowest taking 4 or 5 days to reach Earth.

Solar Wind

The solar wind is a constant outflow of electrons and protons from the Sun, always present and buffeting Earth's magnetic field. The background solar wind flows at approximately one million miles per hour!

Solar Flares

Reconnection of the magnetic fields on the surface of the Sun drive the biggest explosions in our solar system. These solar flares release immense amounts of energy and result in electromagnetic emissions spanning the spectrum from gamma rays to radio waves. Traveling at the speed of light, these emissions make the 93 million mile trip to Earth in just 8 minutes.

Earth's Magnetic Field

Earth's magnetic field, largely like that of a bar magnet, gives the Earth some protection from the effects of the Sun. Earth's magnetic field is constantly compressed on the day side and stretched on the night side by the ever-present solar wind. During geomagnetic storms, the disturbances to Earth's magnetic field can become extreme. In addition to some buffering by the atmosphere, this field also offers some shielding from the charged particles of a radiation storm.

Sun's Magnetic Field

Strong and ever-changing magnetic fields drive the life of the Sun and underlie sunspots. These strong magnetic fields are the energy source for space weather and their twisting, shearing, and reconnection lead to solar flares.

Solar Radiation Storms

Charged particles, including electrons and protons, can be accelerated by coronal mass ejections and solar flares. These particles bounce and gyrate their way through space, roughly following the magnetic field lines and ultimately bombarding Earth from every direction. The fastest of these particles can affect Earth tens of minutes after a solar flare.

Geomagnetic Storms

A geomagnetic storm is a temporary disturbance of Earth's magnetic field typically associated with enhancements in the solar wind. These storms are created when the solar wind and its magnetic field interacts with Earth's magnetic field. The primary source of geomagnetic storms is CMEs which stretch the magnetosphere on the nightside causing it to release energy through magnetic reconnection. Disturbances in the ionosphere (a region of Earth's upper atmosphere) are usually associated with geomagnetic storms.

Space Weather

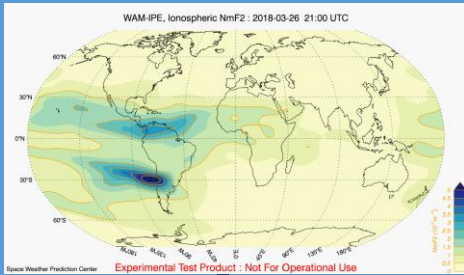

Space weather refers to the variable conditions on the Sun and in the space environment that can influence the performance and reliability of space-based and ground-based technological systems, as well as endanger life or health. Just like weather on Earth, space weather has its seasons, with solar activity rising and falling over an approximate 11 year cycle.

TREC Research Enterprise

Improving and applying existing models, enabling missions, and developing new capabilities to improve space weather forecasting.

MODELS

WAM/IPE
CTIP-e
TIEGCM

Physics-based
drag modeling

MISSIONS / DATA

CAPABILITIES

- Space physics research
- Solar physics research
- Space instrumentation and mission design
- Aerospace engineering
- CubeSat developments
- Astrophysical and planetary Sciences
- Geospace modelling and data assimilation
- Satellite and mission data management

Problem Statement

Transition of new Research models, mission data, and tools to Operational Forecasting is inefficient. “R2O problem”

Satellite Drag

Satellite drag errors degrade capability to:

- Maintain accurate catalog of all space objects
- Predict and avoid space collisions
- Predict satellite reentry time & location

Satellite Drag and the Upper Atmosphere

Large uncertainties in atmospheric mass densities, composition, temperature, and winds lead to unwanted differential drag of orbiting objects

C_D Variability driven by composition changes in orbit

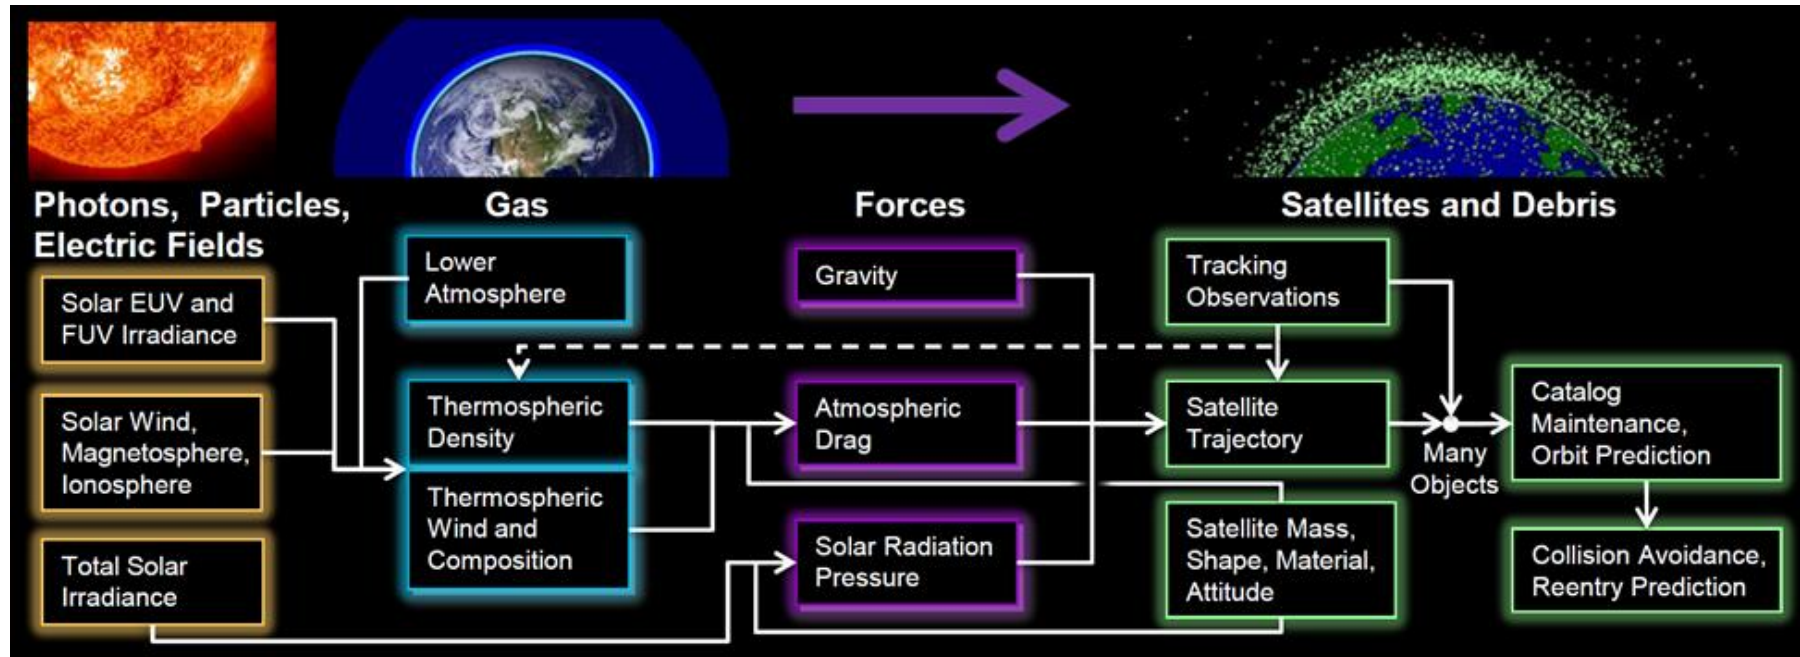

TREC Research

Physics-Based Satellite Drag

Atmospheric drag on low-earth-orbiting (LEO) satellites and debris (< 1000km) is the primary source of uncertainty in affecting their attitude and orbit due to significant natural variability in upper atmosphere mass density and winds.

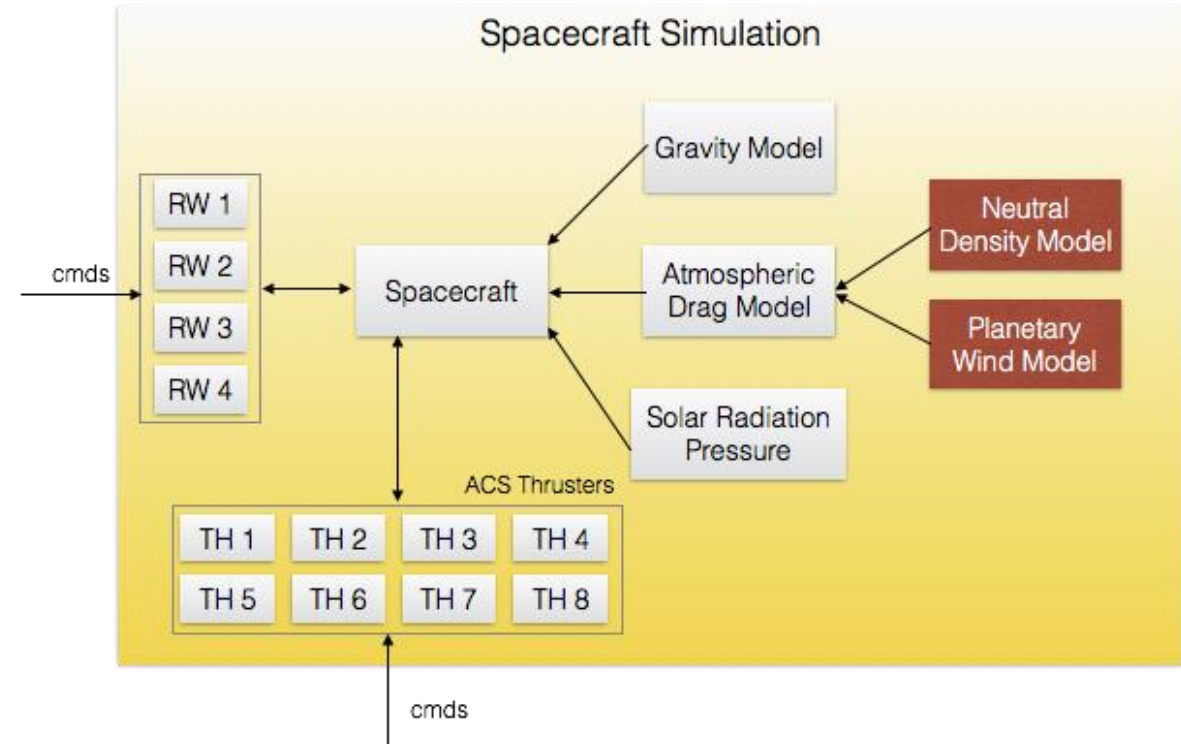

Consequently continuous precise orbit determination, conjunction assessment, and collision avoidance actions that involve not only the spacecraft response to atmospheric drag but the differential drag response of all the other space objects in LEO.

TREC Research

Physics-Based Vehicle Dynamics

Astrodynamics Simulation Software

Modular software framework allows for science modules to be readily exchanged without recompiling.

Permits a tight integration of the space weather science solutions and the astrodynamics analysis.

TREC MADTech

Developing technology to provide parallel operational model testbeds, create new data exploitation/forecasting applications, and merge data for researchers and model developers.

SWx-TREC Education Enterprise

New Courses and Certificates

Graduate Education:

- In development: new ***Space Weather Engineering & Science Certificate (SWx ESC)***.
- Consists of 4–6 courses drawn from the Aerospace Engineering, Physics, Astrophysics, & Atmospheric/Oceanic Sci. Departments.
- Flexible combinations of in-person & online course work.
- Existing material to be adapted from National Solar Observatory's (online) Collaborative Graduate Education (COLLAGE) program.

Undergraduate Education:

- Continued development of “feeder courses” to research projects, internships, or grad school.
- Collaboration with CU's successful ***Space Minor*** curriculum.

SWx-TREC Education Enterprise

Summer Student Programs

- Now in its 18th year
- July 9-20, 2018 Boulder CO
- New leadership:
Stan Solomon (NCAR) &
Steven Cranmer (CU, TREC)

- July 24- 31, 2018 Boulder CO
- TREC is a part of a new **Curriculum Committee** that aims to help US universities adopt & teach the material in the textbooks.

The University of Colorado Boulder's **Space Weather Technology, Research and Education Center (SWx-TREC)** is a national center of excellence in cross-disciplinary research, technological innovation and education.

We enable federal agencies, academia, commercial partners and industry to collaboratively address the nation's evolving space weather forecasting, mitigation and response requirements.

Space Weather

NOAA GOES-16

- [LASP](#) involvement in GOES-R, TSIS, MinXSS, Parker Solar Probe [missions](#).
- [CCAR](#) combined expertise in space weather, space environment, astrodynamics, GPS, GNSS, small satellite systems, and orbital debris
- [CIRES](#) partnerships with NOAA Space Weather Prediction Center (SWPC) to build solar and ionospheric forecasting capabilities.
- [National Solar Observatory](#) co-location with LASP on CU Boulder campus.
- [High Altitude Observatory](#) solar and space physics collaborator in Boulder.

NOAA/SWPC Forecasting Center

Key Faculty/ Researchers

- [Jeff Thayer](#), Aerospace Engineering Sciences
- [Dan Baker](#), Laboratory for Atmospheric and Space Physics (LASP)
- [Nils Halverson](#), APS
- [Cora Randall](#), ATOC
- [Frank Eparvier](#), LASP
- [Delores Knipp](#), Aerospace Engineering Sciences
- [Jade Morton](#), Aerospace Engineering Sciences
- [Tim Fuller-Rowell](#), Cooperative Institute for Research in the Environmental Sciences (CIRES)
- [David Stone](#), CIRES

Core Capabilities

- Remote sensing of the ionosphere, atmosphere, and Earth's surface
- Geomagnetic activity and its effects at the Earth's surface and throughout Geospace
- Measurement and prediction of solar activity and irradiance
- Space weather information technology and data systems
- Modeling, data systems, satellite anomaly information support
- Expertise in space environment, astrodynamics, GPS, GNSS, small satellite systems, orbital debris.
- Planetary systems and space physics

Projects

- LASP designed and built the GOES-R (16) EXIS instrument to detect solar soft X-ray irradiance (XRS) and solar extreme ultraviolet spectral irradiance. XRS helps predict proton events and monitors solar flares. **PI: Frank Eparvier**
- A team led by CU Boulder found the mechanism behind the sudden onset of a "natural thermostat" in Earth's upper atmosphere that dramatically cools the atmosphere after it has been heated by violent solar activity. **PI: Delores Knipp**

Collaborators

Our Space. Our Future.

For over 50 years, CU Boulder has been a leader in Earth and space sciences. We have sent instruments to every planet in our solar system and are among the world's leading public universities in producing astronauts. We explore our own planet from the depths of the ocean to the upper limits of the atmosphere.

What will the next 50 years bring?

CSSP Meeting 30-March-2016

SWx TREC: Bridging R & O

SWx TREC Mission Statement

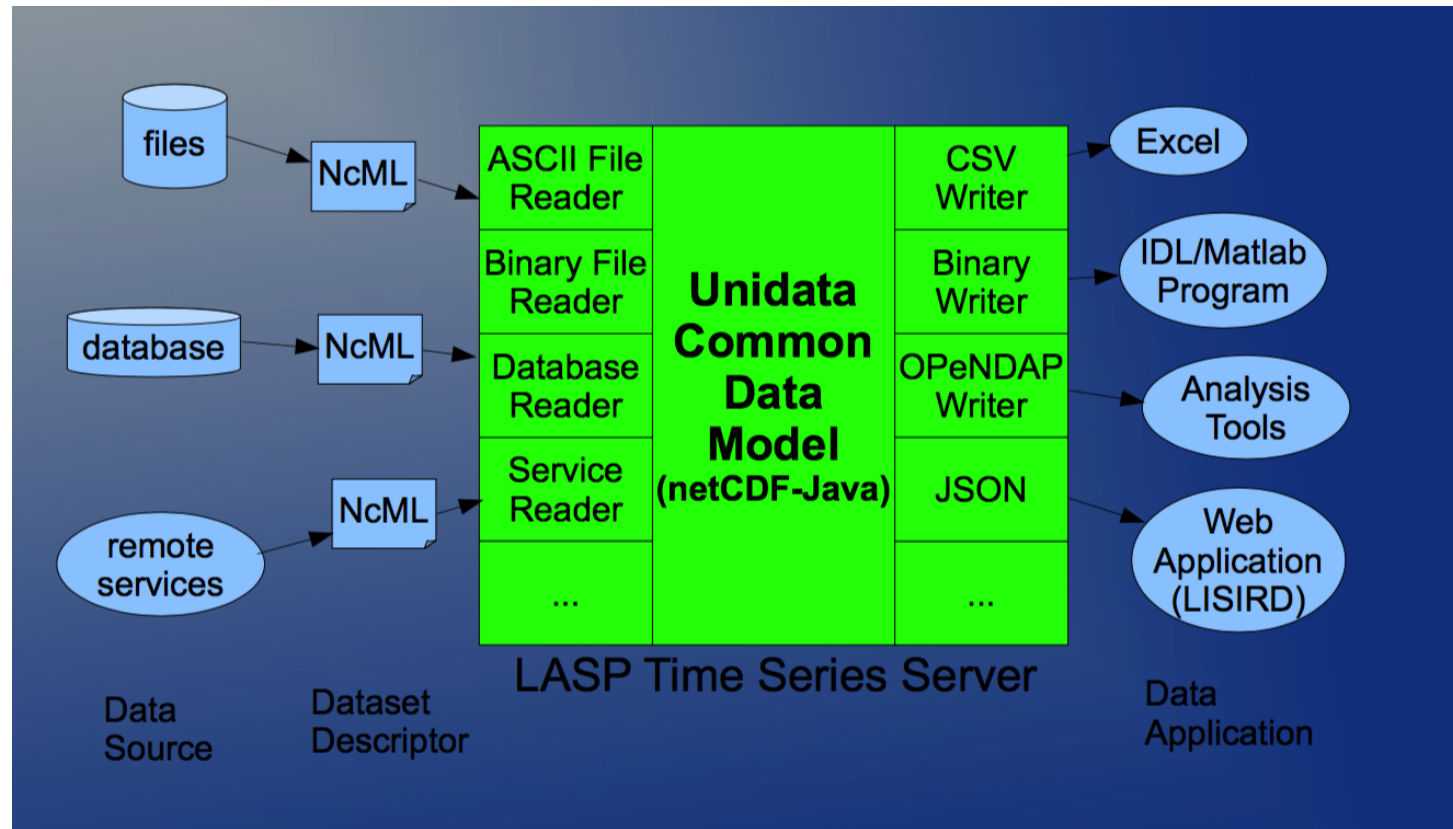

The University of Colorado SWx-TREC is a national center of excellence in cross-disciplinary research, technology innovation, and education, enabling federal agencies, academia, commercial partners, and industry to collaborate in addressing the nation's evolving space weather forecasting, mitigation, and response requirements.

SWx-TREC produces breakthrough applied research and innovative mission technologies that are **directly tied to the needs of the operational forecasting enterprise** to ensure closure of the R2O* and O2R* loop. This will result in new models, tools, missions, and data that will significantly advance our ability to understand and predict space weather phenomena, from the Sun to the Earth.
