Unique Sources of Radiosondes in DSS Archive

Stations in NCAR U/A Archive Reporting At Least 30 Times/ Month

Previous Work

- Many problems already fixed
- Many sources reformatted
- Station locations, elevations corrected
- Hydrostatic checks on most soundings
- Loose QC performed
- Many intra-source dupes removed

Problems

- Varying Units
- Multiple Formats
- Varying Station ID Metadata
- Inconsistent QC
- Duplicates
 - Inter source
- Organization / Discovery
 - Datasets
 - Stations -> data

GOALS

1. Provide an archive of U/A data that contains homogeneous units, format(s), station metadata and QC
2. Support usage of data in multiple ways
 - Output in synoptic or time series
 - Multiple discovery options
 - Access various sources and/or merged version
3. Ability to track **all** reports
4. Support both research and reanalysis communities
5. Easy to Update
 - New Data
 - Bias corrected data
 - Meta data

Why Relational DB?

- Access options
- Separate sources, yet together
- Reproducibility
- Tracking
- Easily expandable

Version 3

- Units homogenized
- Standardized all descriptive flags
- Unique record identifier from V1
 - Sounding ID, Source, Version #
- Standardized DB tables
- Output by source
 - Multiple ascii files / real time
- Improved station meta data
- Complex merge/duplicate elimination
 - Multiple output formats

Version
3.0

Station MetaData

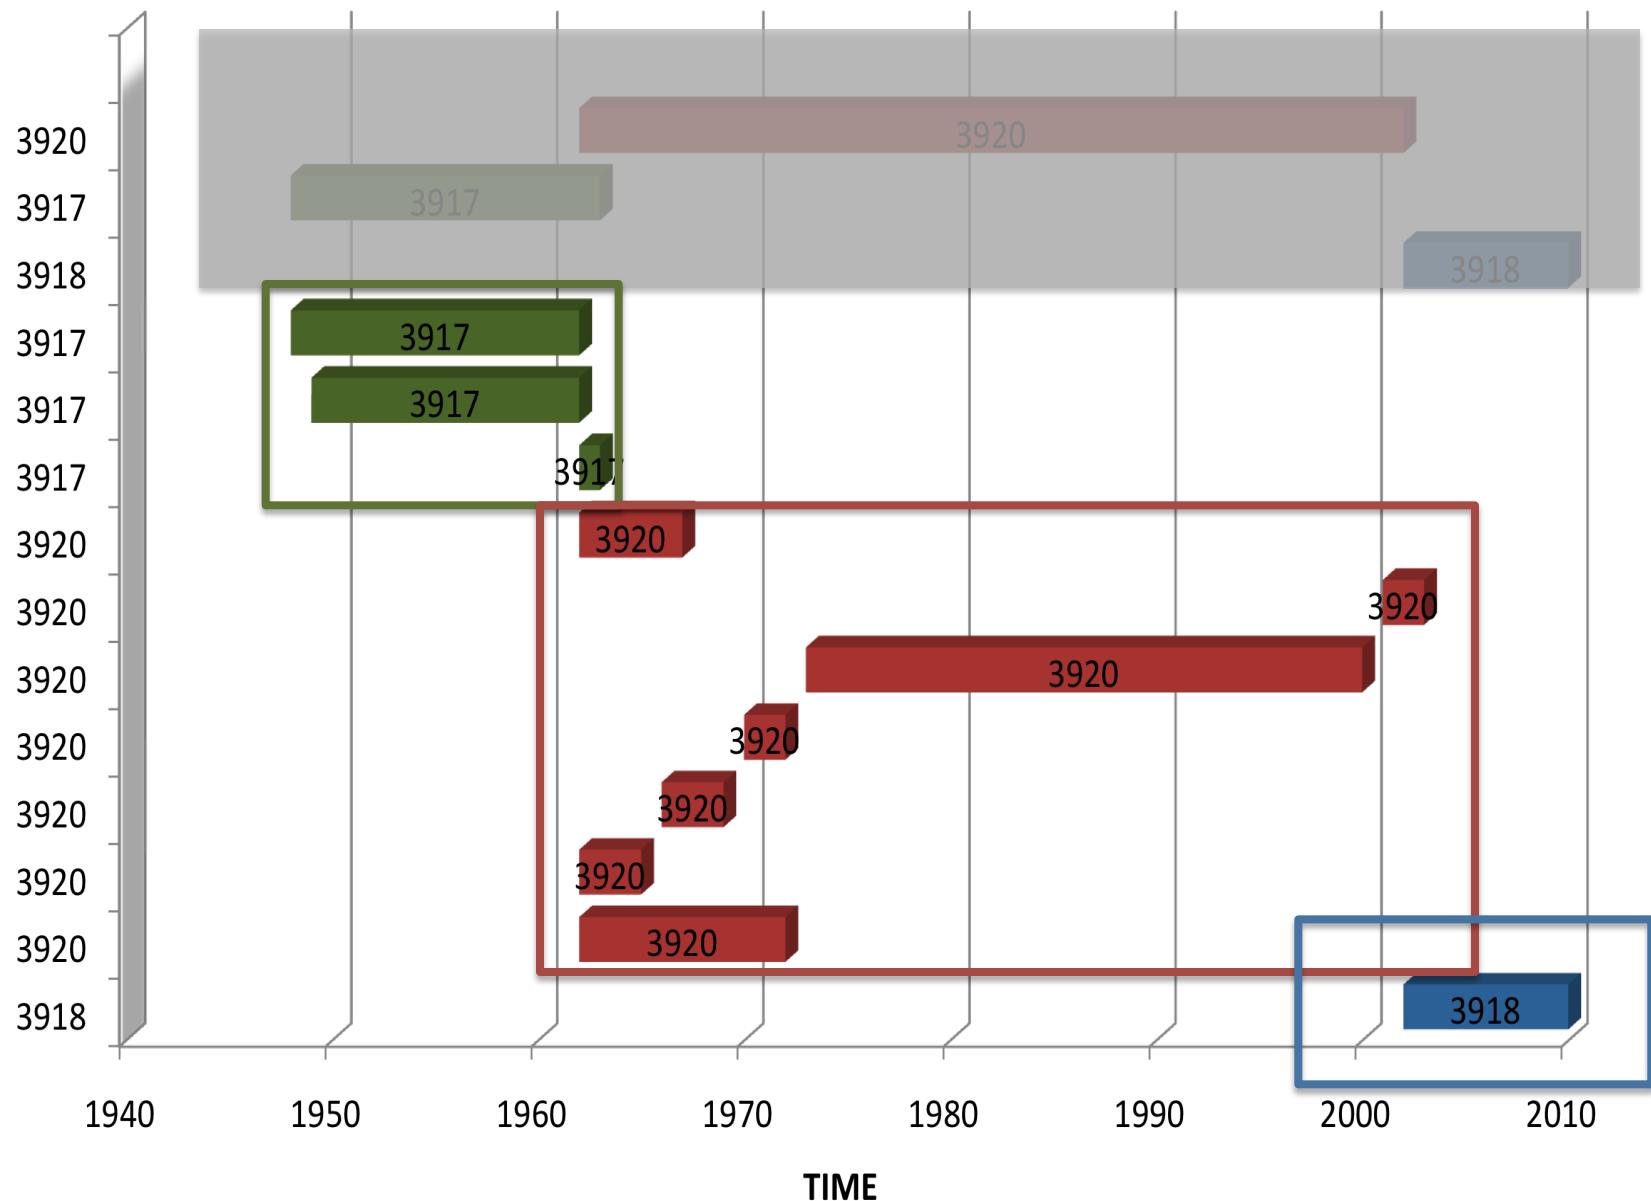

Problems

- Primarily focusing on ID's
- Archive contains WMO, WBAN and other ID's
- Multiple sources use varying WMO libraries
- Not trivial to access full available POR for a station

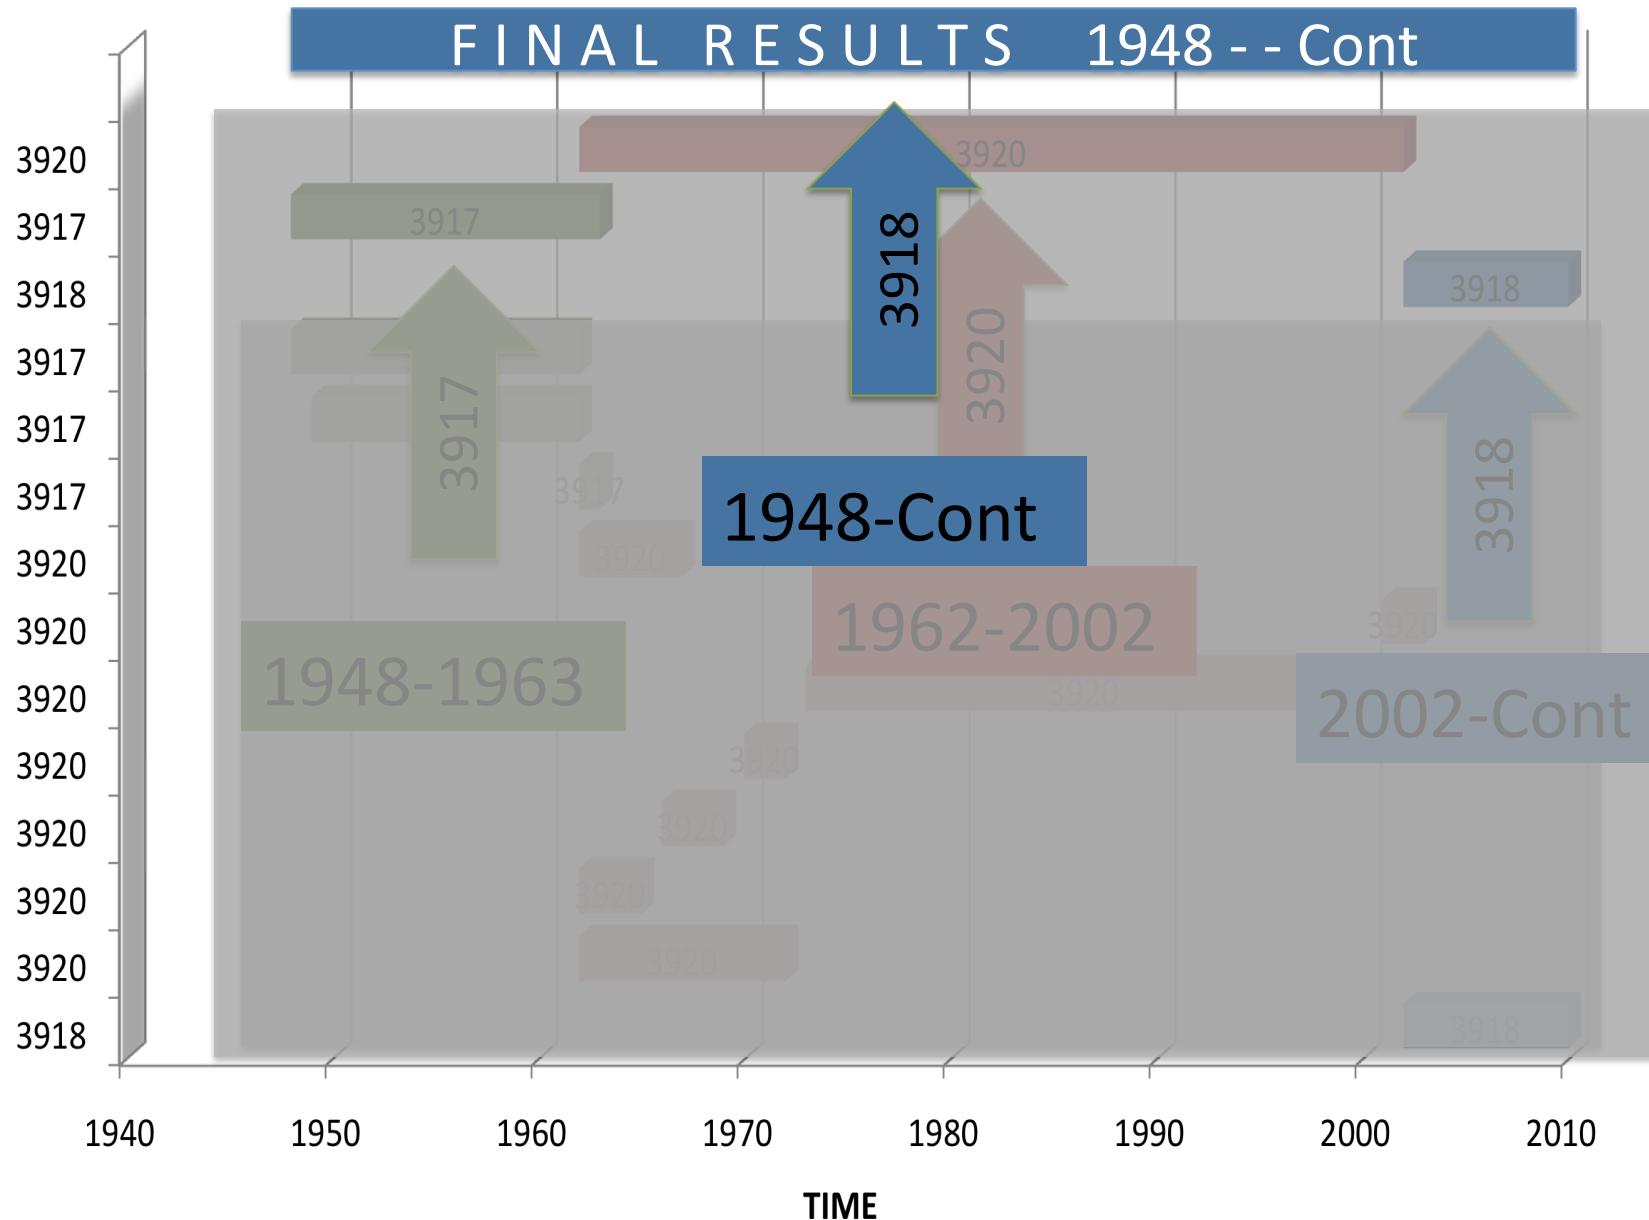

<u>Station</u>	<u>Lat</u>	<u>Lon</u>
3917	54.65	353.78
3918	54.50	353.66
3920	54.48	353.90

Distance : 15-20KM

Analysis of Station for 3920

Analysis of Station for 3920

Station ID Meta Data Library

All locations for each station

Identify Possible Merge Cases

Start with longest chron stations

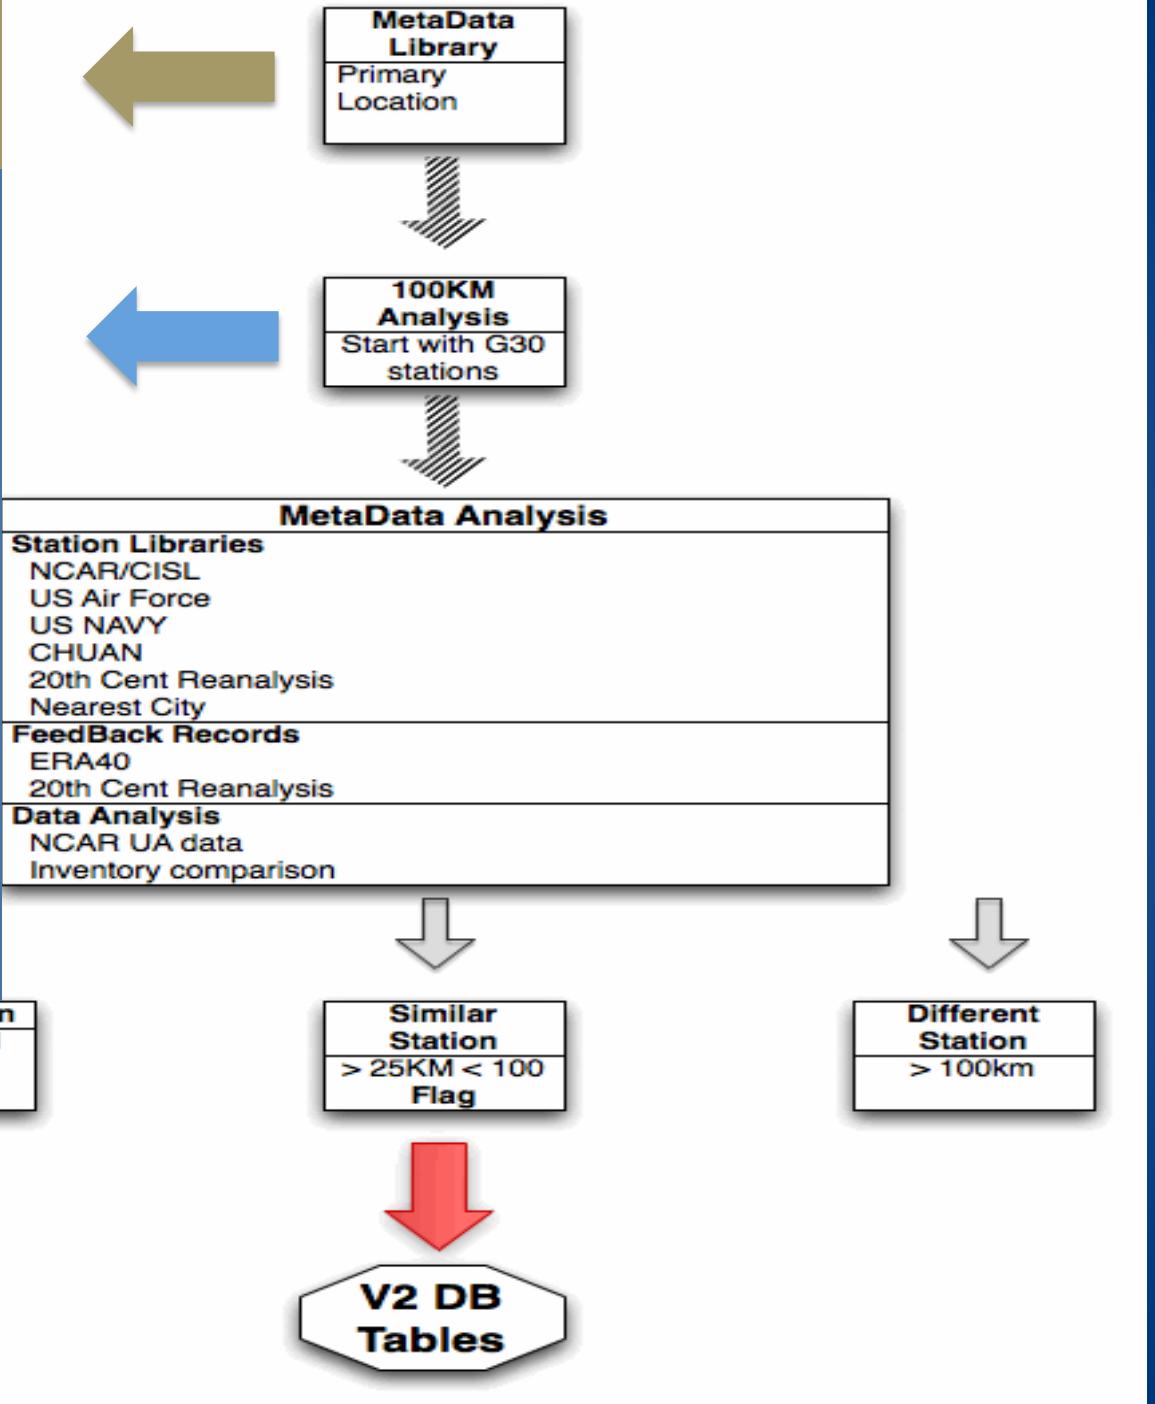

Determine all stations w/i 100KM

-> to DB tables

Results

600 Cases > 20 years

500 cases < 20 years

Meta Data Analysis

- Inventory analysis
- Data analysis
 - Direct Comparison
 - Huber weight function
 - Location and Scale
- Feedback Records
 - ERA-40
 - 20th Cent. Reanalysis
- Station Libraries
 - DSS, USAF, US Navy,
 - CHUAN, 20th Cent Rean
 - City Location DB
- Nearest city DB

Results

Same Station

- <= 25KM
- Flag
- Recommend Merge
- Keep Original ID

Close, Not Related

- >25KM, < 100KM
- Allow Merge
- Flag
- Keep Original ID

Stations Not Related

- Do Nothing

Future Work

- User Interface
- Improve QC
- Possible Cooperation/Coordination of Efforts with NCDC
- More Station Meta Data
 - Instrumentation
- Ingest New Sources
- Ingest Bias Corrections
 - One option for output
- Reanalysis Feedback
- Include Aircraft Data
- Multiple Output Options
- ‘Snazzy’ Acronym?

Summary

- homogeneous ✓ units,✓ format(s), station metadata and QC
- Support usage of data in multiple ways
 - ✓ Output in synoptic or time series
 - ✓ Multiple discovery options
 - ✓ Access various sources and/or merged sources
- ✓ Ability to track all reports
- ✓ Support both research and reanalysis communities
- ✓ Easy to Update
 - New Data
 - Bias corrected data

DSS - IGRA Monthly Station Counts for Stations with atleast 30 Obs / Month
