## **Early COSMIC-2 evaluation**

Model versions: v15.2, v15.3 (C2 operational), and early V16

- Assimilation of C2 resulted in significant degradation in Southern Hemisphere (SH, v15.2) – this degradation was attributed to the assimilation of C2 observations.
  - Adding C2 was a compromise between degrading SH and improving NH and TR. How many observations were allowed by QC set the level of compromise.
- The same level of degradation existed in the pre-operational run at NCEP (v15.3).
  - Need for a quick fix to the pre-operational parallel run so C2 could improve performance and potentially be assimilated operationally at NOAA.
  - After conducting several tests, an updated (stricter) quality control configuration for C2 profiles was delivered. This fixed the degradation in SH (changes rolled into v15.3).

versions.

- Early evaluation of C2 showed larger variability (biases and standard deviation) as compared to other RO missions (v15.2/v15.3 and v16).
- Larger RO biases and standard deviation were confirmed above 50 km v16 assimilated RO to 55 km.
- Sub-optimal errors for COSMIC-2: too small in v15.2 and too large in v15.3/v16 (new error structure was implemented).
- Non-C2 RO variability and innovations had increased in v15.3 and v16 from previous model versions in the lower and upper sections.
- Non-C2 RO errors were too slightly too small in v15.3/v16 as compared to earlier model

#### Wind RMSE

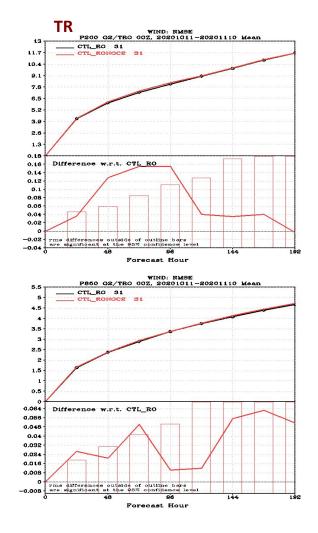

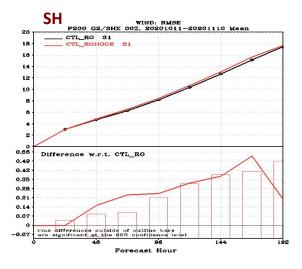

#### Positive impact from C2 in TR/SH (larger in upper levels)

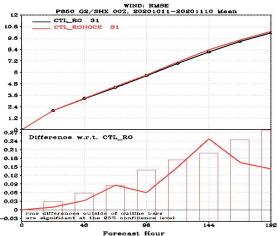

### Neutral impact from C2 assimilation in the NH

# Concluding thoughts

- Current positive impact from C2 though a larger percentage of observations is rejected due to stricter QC
  - Can we optimize performance by assimilating more C2 data?
    - Optimize observation error structures
      - Normalized innovations for C2 are too small errors are too large.
      - Normalized innovations for non-C2 RO are slightly larger than they should be errors are too small.
    - Optimize quality controls
    - Improve forward operators
    - Mix of C2 and commercial data
