Conclusion

- We propose a new method for denoising and upsampling beacon data to a better quality
- Produced images allow a better readability of the CME characteristics
- Running differences and JPLOTS allow us to track the CME similarly to Science data in near-realtime

Future work

- Forecast CME arrival time for **40 selected events**, using beacon, enhanced beacon and science JPLOTS (**ongoing paper submission soon**)
- Tackle the data gaps problem using other view points (COR2)
- Extend the enhancement to HI2

+

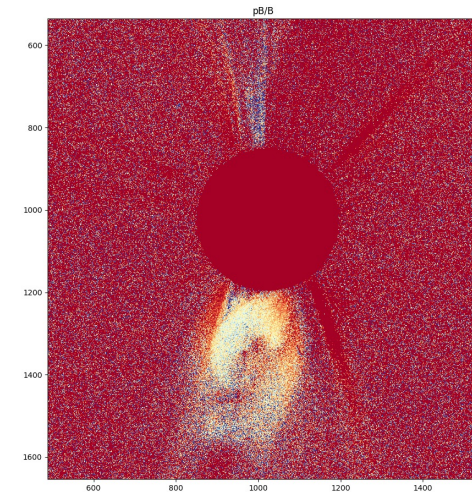

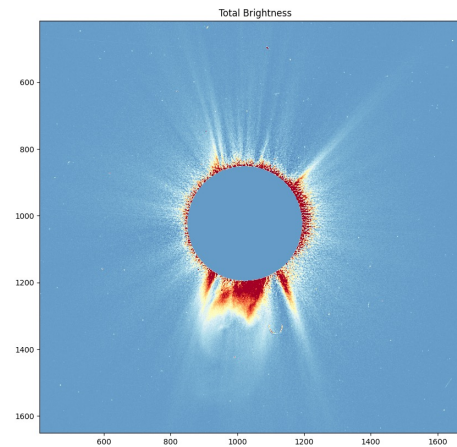

Multi-view of CME events

Oblique view

DeForest et al. 2017

COR2 polarised sequence, pB/B ratio

Combining multiple view points for **tracking** and **reconstruction** of **CMEs**, while obtaining **localisation** of important features with **polarisation**.

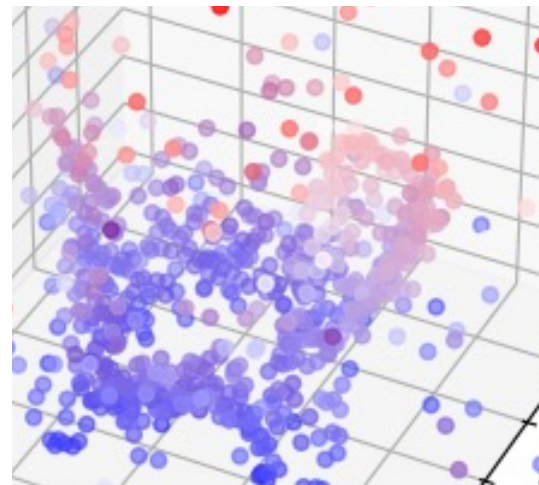

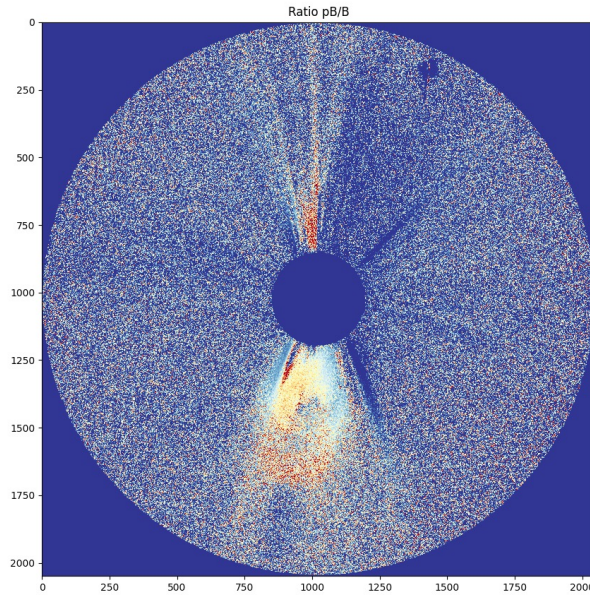

STEREO HI automatic tracking of CME (Bauer et al. poster)

Oblique view

DeForest et al. 2017

Multi-view of CME events

COR2 polarised sequence -> 3D representation

Depth based 3D reconstruction

Summary

- Use **Stereo + Punch** data together for a more efficient tracking and reconstruction of CMEs
- Adding polarisation to multi-view reconstruction for better localisation and shape
- Tracking CMEs from **very early on** and for **longer** through STEREO HI1 and PUNCH WFI
 - + Inferring other physical properties such as chirality

Further ideas

- Combining other spacecraft's visual data (LASCO, WISPR ...)
- Unified and open-source vision stack in **Python** (converting IDL code + new processing analysis codes)
 - *STEREO COR2 and H1 ready*
- **ML ready** datasets and processing code + computer vision models
